INTRODUCTION
The VQ23 is an improved poison-resistant sensor consisting of two matched elements which are used for the detection of combustible gases, particularly methane in air mixtures in concentrations from 0.1% upwards. There is no interference from water vapour or carbon dioxide. Using the recommended bridge circuit below and the mounting arrangement shown on page 3, the minimum sensitivity is 10 mV/% methane. The VQ23 has been designed for use in atmospheres where traces of silicone and other poisoning agents may be present.

GENERAL DATA

Electrical
The information given below relates to the VQ23 operating in the recommended circuit shown.
Operation (see note 1) continuous
Bridge supply 2.5 ± 0.1 V
Bridge power consumption 1.1 W max
Typical average sensor current 335 mA
Minimum sensitivity (see note 2) 10 mV/% methane
Linearity linear up to 5% methane
Response time to register 1 1/4% in a 2 1/2% concentration (see notes 2 and 3) 2 seconds
Maximum methane concentration (see note 4) 5%

Mechanical
Mounting see page 3
Outline see page 2

BRIDGE CIRCUIT

MARKING
Each element is identified by a unique serial number written on the can of both the detector and compensator. The serial number is written in red on the detector and black on the compensator. In addition, the detector carries a red circular label on the base identifying the device type.

NOTES
1. Operation may be under either direct flow or diffusion conditions in appropriate mountings (see page 3).
2. With open-circuit conditions at the bridge output.
3. The response time is a function of the type of mounting used.
4. If the VQ23 is exposed to greater than 5% methane concentration, the calibration of the instrument should be checked.
5. The elements are supplied as a matched pair with a trimming resistor R of the correct value which is supplied where necessary. The trimming resistor is to be connected across the compensator element as shown below.
6. The resistance to poisoning by silicone compounds is partly dependent upon the type of housing within which the elements are mounted. The results shown on page 2 were obtained using a flow housing shown on page 3.
7. The response to certain of the heavy flammable vapours especially aromatic substances with side chains, may be lower than that calculated from the conversion (K) factors listed in the preamble.
TYPICAL RESPONSE OF VQ23 AND STANDARD PELLISTOR WHEN EXPOSED TO HEXAMETHYL DISILOXANE ATMOSPHERES

OUTLINE (All dimensions without limits are nominal)

Note  No bends may be made in this length.
RECOMMENDED MOUNTING ARRANGEMENTS

FILTER PAPER AND 60 MESH STAINLESS STEEL GAUZE

FLOW RATE 500 cm³/min

60 MESH STAINLESS STEEL GAUZE

LEAKPROOF JOINT
